Three horns in the fossil record

Triceratops lived about 68 to 66 million years ago, during the Late Cretaceous. Its fossils have been found in what is now the United States. This plant-eating dinosaur walked on four legs. Its head had three horns and a large frill. Scientists study fossils to learn about animals that lived long before people.

Find the facts

1. When did Triceratops live?

2. What did it eat?

3. How many horns did it have?
